

# Working Prototype Known Problems Report

Truck-d 12/02/19

List of functions not working correctly.

1. General
  - a. We do not check for valid email or phone numbers on forms(just existence of input data)
  - b. If the page is ever refreshed during use, all state will be lost and the user will need to sign in again(if a vendor) or restart their order(if a customer). This could be fixed in the future with the use of cookies.
  - c. If the API receives a JSON object that does not contain a certain 'key' a 'KeyError' error will be thrown and the remainder of the function will not be run.
2. Customer
  - a. Vendor\_search
    - i. Will return a list of all vendors if one of the 'restaurant,' 'address,' 'city,' or 'state' fields is an empty string.
  - b. Vendor Menu Page(order screen)
    - i. Customer will need to go to the checkout screen to see the cart.
  - c. Checkout screen
    - i. Successful order status alert stays on screen after navigating away and then back onto checkout screen
3. Vendor
  - a. Profile Editor
    - i. Loading spinner shows on page load, profile update, or menu item change
    - ii. Edit Menu item doesn't autofill the modal with the existing menu item data
  - b. Order queue
    - i. Orders are not sorted by time ordered(appear random in list)
    - ii. If you 'cancel' or 'finish' right before an order fetch takes place, the order may appear on the screen until the next update cycle removes it even though it was deleted from the database
